

CANADABRED TERMINAL GENETICS

Outstanding Sire Line Genetics

Canadabred is your full-service source for top quality terminal genetics.

OSI sires are known for their strong performance in hog finishing operations, and their exceptional meat quality. By using only purebred Durocs or other Duroc Cross terminal lines, our customers can take full advantage of these important traits.

Canadabred terminal boars produce high quality, lean pork. They have been tested and selected for average daily gain and feed conversion, ensuring their offspring can grow to a heavy weight quickly and efficiently. Back fat, loin depth and lean yield are excellent. These traits combine to form a complete market hog designed for maximum profit potential.

Thorough genetic evaluation

All Canadabred Sire Lines are evaluated through the Canadian Centre for Swine Improvement (CCSI). Selection is based on:

- Lean yield and growth
- Consistency through reduced variability.

CCSI is home to the largest genetically connected nucleus in Canada, ensuring a diverse source of superior genetics.

Further information can be found at www.ccsi.ca.

Physical conformation

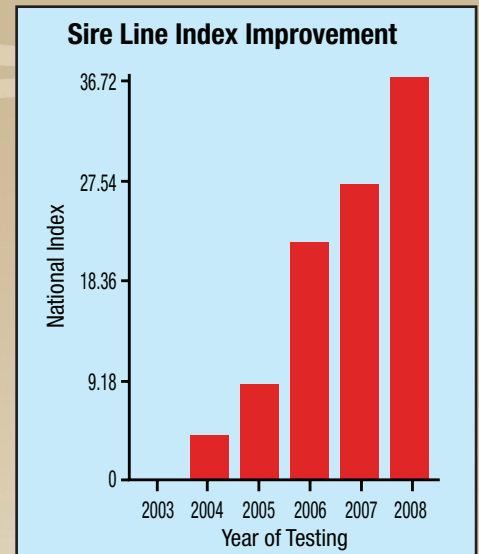

All Canadabred boars are selected for superior conformation traits:

- Feet
- Legs
- Toes
- Overall structure.

Comprehensive sales and service support

Canadabred delivers custom selection based on your operation's needs. We provide 100% transparency of our health monitoring and reporting, genetic evaluation and pedigrees.

Complete production and technical support are available to ensure our genetics deliver results you expect in your operation.
